

In this demo i'm going to show transition state beta where i'm going to essentially send and receive data continuously kind of working off of the last demo video i'm still reading from the sensor .. real time .. and .. what's how this is going to work is my program is pretty much going to send data and listen for data continuously and then eventually stop.

So let's get into it as you see here my base station is still listening these are two .. data these are the two system healthier that i received in .. from the last demo in this case i'm gonna run a different program .. that i have .. code that i have written to .. send and receive data can send data continuously.

And so what's going to happen is you should see the data populate here on this database in the cloud and it should also work for the website. I'm just going to close this and open up a fresh one so you can see it work but ... sending your data populates in the cloud

And again as you see here the visuals are updated automatically. And same thing as last time again I log into the website. And once i've logged in it should it should show the updated data also coming in as well

And as you see here .. it takes a little bit of time to propagate but yeah it .. it updates .. and that's the end of the demonstration for .. this for transition state beta.
